Biologically-Inspired
Adaptive Dynamic Walking
of the Quadruped on Irregular Terrain

Hiroshi Kimura
Univ. of Electro-Communications,
Tokyo, Japan

CONTENTS

1. Introduction

2. Walkig using CPG and reflexes

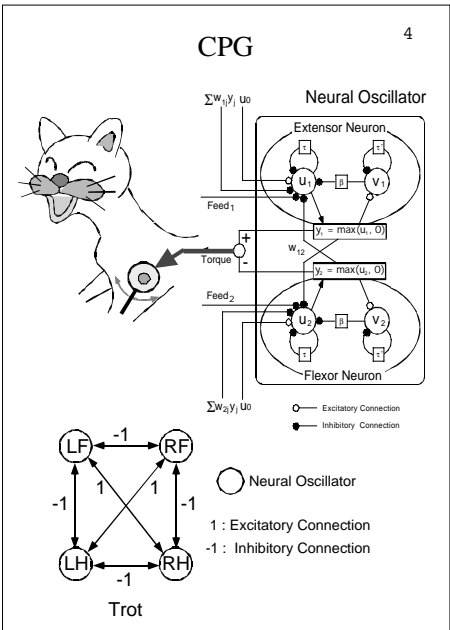

3. Adaptive walking on irregular terrain

4. Discussion

5. Summary

Videos

2

Walking is a good application
for biologically-motivated robotics.

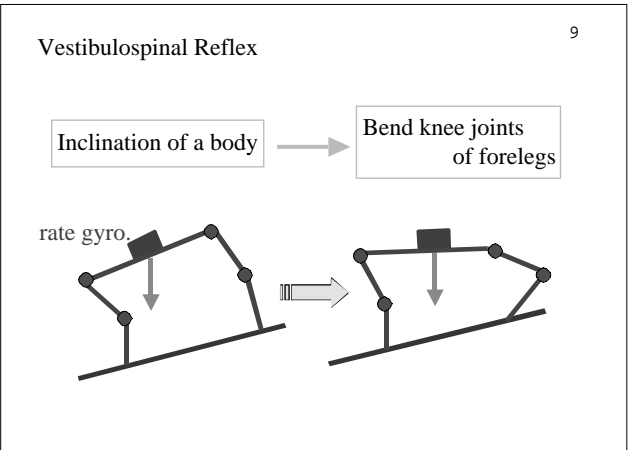

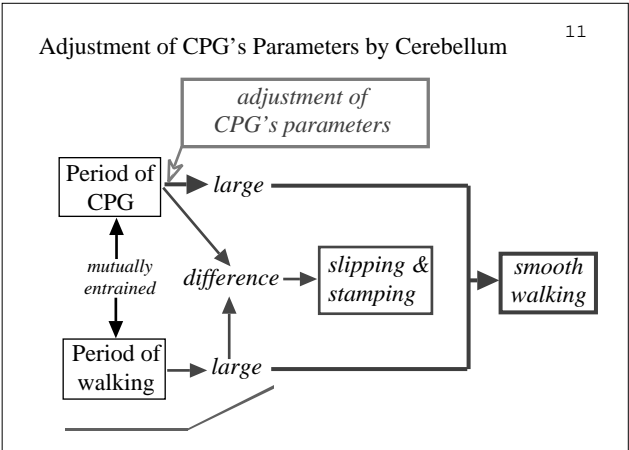

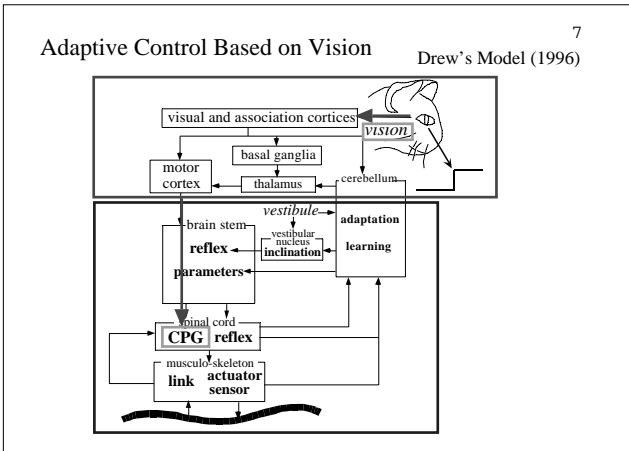

Because

Easy evaluation of the results.

Long history of studies in biology, physiology, etc.

Comparison with a conventional robotics method
based on physics.

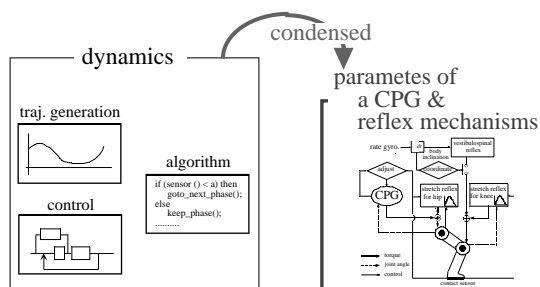

Coordination of Reflexes by Cerebellum

Advantages of Biologically-inspired Control #2

Parameterization

Actual Control Diagram of a Leg

Legged Locomotion Studies in Robotics

various aspects

to develop a practical walking machine

to clarify a real nature of legged locomotion by

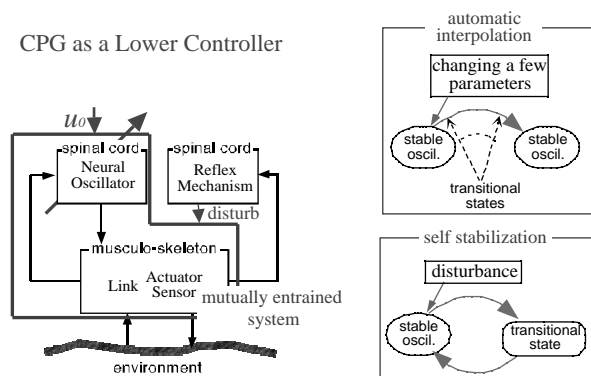

analysis of passive dynamic walking and hopping
realization of dynamic walking and running by simplified control

in view of dynamic adaptation to irregular terrain

➔ realization of adaptive dynamic walking by simplified control

Advantages of Biologically-inspired Control #1

CPG as a Lower Controller

Summary

In addition to CPG and stretch & flexor reflex, we proposed following adaptive control:

muscle stiffness model

vestibulospinal reflex

parameters adjustment of CPG

& reflexes coordination

motion switching based on vision
